Terranova2.1 Update

Left: Standard
Center: Light
Right: Dark

After hearing from some of you we determined that we have three different types of Terranova2.1. Although the same color palette can be achieved with all three of them, they require different heat treatments. We designed a new test that is more sensitive to changes in how the glass strikes. Using this test we went back and retested all the Terranova2.1 currently in production. We have separated them into three categories to help you achieve as repeatable a process as possible. A very small number our resellers received Terranova2.1 Light and they have been contacted. We are replacing their stock right now. Check out

Terra2 is Coming April 9th! 2010

Left: [Terra2 reduced and encased](#). Right: encased and struck.

She's back! Terra was originally released in April of 2007 and was our most popular color. Unfortunately the formula was unstable and we could only produce a few batches of her. We've been trying to solve the mystery for 3 years while you pleaded with us to bring her back! Finally the mystery is solved and Terra2 is here! Using the same colorant system we used in the original Terra but in a stabilized formula we have recreated Terra. She is opaque; she lusters and maintains her luster under clear. She strikes and does it easily under an encasement. Based on test batches # Te-317, TE-320 and TE-362. We recommend you work hot, cool, reduce and encase.

New Murrinis!

[Style # 6](#)

Available April 9th in 1 oz tins. Three different styles to choose from.

our new product page for Terranova2.1 where you can choose our standard, light or dark varieties.
